# **Space systems — Unmanned spacecraft — Estimating the mass of remaining usable propellant**

**bsi.**

...making excellence a habit.™

**National foreword**

This British Standard is the UK implementation of ISO 23339:2010.

Although this standard contains requirements for estimating the amount of usable propellant on unmanned spacecraft in order to enable end-of-life disposal manoeuvres, some of the content of the standard may overlap, or be at variance with, the top-level space debris mitigation standard BS ISO 24113 and the flow down of requirements to other debris mitigation standards. In the event that such a circumstance should arise, the UK committee recommends that BS ISO 23339 should not take precedence.

The UK participation in its preparation was entrusted to Technical Committee ACE/68/-/3, Space systems and operations - Operations and Ground Support.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.
