
**Petroleum products — Determination
of saponification number —**

Part 2:
Potentiometric titration method

Produits pétroliers — Détermination de l'indice de saponification —

Partie 2: Méthode par titrage potentiométrique

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 6293-2 was prepared by Technical Committee ISO/TC 28, *Petroleum products and lubricants*.

This first edition, together with ISO 6293-1, cancels and replaces ISO 6293:1983, which has been technically revised.

ISO 6293 consists of the following parts, under the general title *Petroleum products — Determination of saponification number*:

— *Part 1: Colour-indicator titration method*

— *Part 2: Potentiometric titration method*

Annex A forms an integral part of this part of ISO 6293.
